

TWINNY | FLAX

KEY FEATURES

This Twinny model was inspired by an original Ben Aipa Twin fin. Amazingly fun board for all conditions (just about).

To be surfed 4 inches shorter or 2 liters more than your standard shorty. Comes with a third stabilizer fin for the not so daring.

Updated for 2020 with a swallow tail for additional hold during turns.

rocker : low

fins : fcsII or futures

bottom : single to double

outline : swallow

construction : eps core, high grade fireglass cloth, 56% bio epoxy resin, flax ud cloth

TEX | FLAX

KEY FEATURES

The Tex is a super stubby little thing for when the waves are super small or you're just feeling lazy.

The bloated girth and thickness of Tex will get you trimming and turning on any wave that breaks.

The contemporary single into double concave gives this craft plenty of spark. A balanced outline combined with a large round squash tail helps with the control of this little animal.

Aloha Surfboards ECOSKIN Technology is a small step toward producing surfboards that are manufactured with more Earth friendly ethics.

Paulownia timber is perfectly suited as a sustainable alternative in surfboard production due to its naturally high strength to weight ratio! One of the fastest growing trees in the world Paulownia production places less stress on the environment saving water and natural resources!

Expanded Polystyrene (EPS) foam is very light and strong. EPS foam has more buoyancy and floatation increasing paddling speed and manoeuvrability.

Epoxy Resin is a healthier alternative to polyester as epoxy emits 50-75% fewer VOCs, decreasing the amount of harmful chemicals released into the environment.

ECOSKIN Surfboards are utilising less toxic materials during production and through these measures we are taking steps to decrease our carbon foot print

Aloha

BLACK | PANDA

The Black Panda is a feature packed groveller which absolutely flies down the line and can be turned on a dime. It has lot of available volume squeezed into a small board to keep the foam both under your chest and feet. The outline is wide which is offset by a flyer by the fins that keeps the tail width more refined.

The tail is the often overlooked diamond tail, which has the benefits of the bite of a swallow tail with the hold and control of a rounded pin tail and perfectly sets up the the water flow of the bottom contours. The Black Panda has a soft channel that runs right through the centre of the board and feeds water to the fins, this gets it up and running really quickly and when put on rail feels like it is on tracks.

The Black Panda, being a groveller, is best ridden with one or two litres more than your shortboard. Summer surfs and lousy looking waves will never look more fun than with a Black Panda in the quiver.

Proven to be a very versatile performer in a wide range of wave conditions from 1' ~ 8' all around the surfing world; thicker wider and shorter with more volume and buoyancy than you have had before, easy to paddle and catch waves, easy to control, with more speed than you have had in years! When it starts to barrel, you will be laughing.

D V S | W A S P

The Wasp is a swallow tailed, fish type shape that is quad finned and it has a sting in its tail. Its bottom configuration is a single concave in the front, going into a double concave vee in the tail and the deck is concave in the back half, so you are actually standing in it and not on top of it.

It has a flat carbon stringer which gives the board spring and allows the tail to twist under pressure. Very unique.

DVS | MICRO

The Micro has a round nose, pointed round tail combination outline and is flat rockered with a touch of extra tail lift. The bottom configuration is a single concave up front into a double concave Vee with a thruster fin set up. The fuller outline and flat rocker makes catching waves easy and the "Micro" is like a flying sled that fire up in just about all conditions.

D V S | M A L

The Longboard in this quiver is the Allrounder. This is no round nosed log, but a highly responsive surfboard that can handle many conditions from 1ft to 8ft. It has a slightly pointed nose, a fullish pintail outline and the bottom is a single into a double concave vee. It can noseride, trim, as well as pull into the tube in hollow waves. It's a very versatile design."

The Skipper has a generous amount of volume under the chest allowing easy paddling and you will be able to ride this board shorter than your normal short board. It is a wave catching machine designed for the everyday surfer riding everyday waves!

The pulled in round tail performs well in a wide variety of conditions, I prefer to ride as a thruster in beach break conditions and as a quad in more hollow or point break style setups.

This board is user friendly and fun!

AGENCY | BULLANT

XEPS

EPS | CORE

EPOXY | RESIN

PLY | STINGER

BLUEDIAMOND | FIBER

The Bullant is perfect for waves shoulder high and under, I have found that having this board in my quiver means that I surf more due to its performance in very poor conditions. The Bullant is ideally suited to a Quad fin setup and I have been using the Futures Middle Finger along with the S4 by Simon Anderson but the Futures Controller are perfect fit for the Vector Foil through the tail. The bottom has a full-vee with a double concave which starts from the centre, this enables an extremely fast acceleration! As soon as you get to your feet you can feel the Bullant Take Off! The beveled rail lessens the volume for increased sensitivity in rail to rail turns whilst providing greater buoyancy and maintaining a performance rail profile. The wide diamond tail provides multiple pivot points for fast direction changes off the back foot!
